Field of the Invention The present invention relates to a solid-state imaging device which is employed in, e.g., a facsimile machine, a digital camera, and the like, and a manufacturing method thereof. 2. Description of the Related Art A solid-state imaging device is widely employed in facsimile machines, digital cameras, or the like. FIG. 17 shows a cross sectional view of the structure of a solid-state imaging device 100. The solid-state imaging device 100 is formed on a semiconductor substrate 101. The semiconductor substrate 101 is provided with a light receiving element group 102. The light receiving element group 102 includes a plurality of light receiving elements 102a which are arranged in a matrix. The light receiving elements 102a include a photodiode (PD). On the semiconductor substrate 101, a light shielding film 103 is formed. The light shielding film 103 is provided with an opening which exposes a predetermined area of the light receiving element group 102. The light receiving element group 102 is covered with an anti-reflection film 104. The anti-reflection film 104 has an opening which exposes the light receiving element group 2d92ce491b
