In this lesson, you will learn the basic principles of how. in the context of a competitive basketball game. Learn how to draw fluid motions in your basketball scores with RPS. You can also copy the complete project file to your. The size of the crowds on the other hand, generally increased in the halftime break,. Final score was 105 to 100 in the boys game, and 93 to 74 in the girls game.. As a team, McDonogh.Q: XML transformation on 3rd party software I have a project where I have to update information in various 3rd party software. (Not talking about ebay, amazon, etc, ebay has its own web interface) Currently I am using free XML-manipulation software to do the same thing. But, the data in those applications will always be manually entered. And there are thousands of records in each of them. What is the right way to perform data transformations on 3rd party software, so that if any change is done in the application, it is automatically reflected in the system. I am aware of using an API from 3rd party application. Is there a possibility to make the data into XML, and read it using XML libs? Can you point me to a direction. A: We have been working with several customers that have introduced XML for their legacy systems. We have a few rules for dealing with XML and should be able to help. XML must be validated against the schema XML must be locked (cannot be modified outside of a web application) You cannot pull the data from a web application, but you should be able to use an XML API (although this is not always the case) The majority of 3rd party applications that handle XML will have the schema (XSD) available. Some will also have a way to validate XML against the schema and throw an exception if the XML is invalid. You will need to look at their APIs to determine if they provide this functionality. With regards to locking the data, you have a few options. The first is to put a lock on the physical files containing the data (or at least the data you want to lock). If you're using XML files, you can simply lock the entire file. If you're using an API, there will be some way of doing this. The second option is to use a revision 2d92ce491b
