Q: Trying to publish to same Xamarin android platform I've a UWP project with Xamarin, and now I'm trying to include the exact same project (as a setup) on the same device, that has the UWP project too. I'm getting this error: Exception thrown during Visual Studio publish. The Xamarin.Android project "MyApp" does not have a package name defined. I'm doing the publish through Visual Studio 2015, connected to the same physical device. I found this post, and tried what's said in it, adding this to the app.cs: AndroidPlatformSpecificConfig.EnableAutoPackageName(this); But I got this message: Could not find configuration section 'AndroidPlatformSpecificConfig' in project 'MyApp'. Now I'm out of ideas, I've wasted more than 12h now and I can't publish a damn thing. Any ideas? A: In short, there are two different Android platforms in Xamarin for now. I've found the description of them here. With the very first Xamarin, it was only one single Android platform. That is, "Android" was always the name of the target framework. The way it was labeled was like "Android NDK". All Xamarin versions have always used that word. In the early days, it was hard to differentiate which platform you were working on, so it's very common to use the term "Android" even though it really is the "Android NDK" platform. This changed in early 2017 when we added a second Android platform, and the term "Android" will be used for the base platform, and "Xamarin Android" for the toolchain version. That means that AndroidPlatformSpecificConfig section is part of the old Xamarin Android. Now in Xamarin.Android 10.1 you can specify platform name, like this: var p = new AndroidPlatform(new[] { Android.Content.PM.PackageManager.GetInstalledPackages(PackageSource.User), Android.App.Application.Context
