KeyMacro is a powerful, easy to use keystroke macro recorder. If you want to record a keyboard macro you need KeyMacro. With KeyMacro, you record just a few keystrokes on your keyboard and KeyMacro automates them for you. KeyMacro has a built-in editor, so you can edit your macros on the fly. There are three modes of operation, capture, edit, and replay. You can also manually specify which keystrokes you want to record, with the preview. KeyMacro has three modes of operation, capture, edit, and replay. Capture mode: This is the default mode of operation. It captures keystrokes and saves them in a text file. With the capture mode you can record any keystroke combinations and any sequence of keystrokes. To record a sequence of keystrokes, hold down the SHIFT key as you press the first keystroke and release it, then hold down the CAPS LOCK key as you press the second keystroke, and release the CAPS LOCK key as you press the third keystroke. If you want to skip any keystrokes, hold down the SPACEBAR key during the keystroke sequence. You can skip any keystrokes when recording by holding down the SPACEBAR key at the beginning of the sequence and releasing the keystroke when you want to skip a keystroke. The macro is saved in a text file, for example 'macro1.txt'. The name of the text file is the name of the macro, for example 'macro1.txt'. If the macro name has spaces or any other special characters, you must enclose the name of the text file with double quotes, for example "macro1.txt". You can rename the file by clicking on the "Rename..." button and specifying a new name. To change the name of the text file, click on the "Rename..." button. The default name is 'macro1.txt', so when you click on the "Rename..." button it will be renamed to 'macro1.txt'. You can change this to another name by clicking on the "Rename..." button and specifying a new name. After recording, you can see what the macro does, by clicking on the "Preview" button. If you are not sure whether you have recorded all keystrokes, you can review your macro by clicking on the "Edit" button 70238732e0

> Keymacro is an open source iPhone app which help you to select key from the terminal, then you can type a sentence, make a call or send a message for free. It only cost US$0.99. Google's Chrome browser is used by almost all users out there. In recent years, the browser has had some security issues, though, that's not the only thing that Google did right. Another thing Google made was a browser that took care of crashes with a subtle background notification. Downloading the latest browser update is what Chrome does every time it gets its next security update. The update only takes a couple of minutes and during the time you're downloading Chrome is as stable as you can get it. The Update Allowing webpages to run any code that you see will make webpages much more vulnerable, which is why Google put such a strong effort into this process. Since Chrome does not use a sandbox, any code that runs will run without any restrictions. These include code from any website, not only malicious ones. With the increased capability comes an increase in the chances for users to be attacked by malware. Since Chrome does not place any restrictions on any of the code that runs, and since the browser does not run in a sandbox, the malicious code can execute on your device as if it was a native app. The Code Instead of getting a new beta version of Chrome, all they did was release a new revision of the code that the browser runs on. This version is the stable version of the browser and is referred to as Chrome 75. Once the stable update was released, it was only a matter of time before the malicious software makers came up with a suitable exploit and started abusing it. Google closed the new bug within hours and deployed a fix in their nightly builds.

Read Also: Top 5 Best Free Lockscreen Apps for Android The Bug It appears that the malicious app was coded to be compatible with the stable build, so it will work with Chrome 75 as well. The bug is in a built-in shared library for Chrome, that is supposed to handle screen unlocks. When the malicious code tried to open the screen unlock mechanism, it found a way to get around the security checks of the library, and used that to make it open up a full-screen app. Google's Response After it received a report about the
