How do you pronounce that? 'It is pronounced "Hibachi".' [Jesse Romero] "Hibachi is an uppercase H." [Jesse Romero] "It's pronounced "Hibachi". In the end, it's not the sound you make. It's the sound you make when you put the smoke in your mouth and blow it out through your nose." [Jesse Romero] How To Use this page When viewing the page with one of the search tools (Google or Bing) try using the site search to search the page instead of typing a search query directly into the search box. This tool will also allow you to find the page's URL. Any queries should be sent to the webmaster. If you know the actual URL to the page you are looking for then try going directly to it. Sometimes the HTML page is not shown directly by the web server. If you know the URL to the HTML page you are looking for then try going directly to it. Study of the mechanism of membrane activity of apocytochrome c in phospholipid membranes. Apocytochrome c was found to cause the formation of a gel-like membrane on the lipid bilayer membranes at low concentrations. With increasing apocytochrome c concentration, the membrane activity increased and caused lipid aggregation. An increase in the apocytochrome c concentration led to the formation of a gel-liquid crystalline membrane. The membrane activity of apocytochrome c was dependent on the lipid composition of the membrane. Phospholipids with higher T_m caused more gel-like membrane activity. The results indicated that the effect of apocytochrome c on the membranes was dependent on the lipid order of the membrane. The activity of apocytochrome c was much higher in the gel phase than in the fluid phase. The membrane activity was regulated by the electro
