The Installation Guide is a PDF file that you can download from the download site. WinRunner 7.0. The tool includes more than 40 automated testing capabilities and supports testing for both Windows and web applications. This document contains a full list of the testing capabilities and functionalities available in WinRunner 7.0. WinRunner 7.0 has a new Test Manager and Scanner tool. The Test Manager allows you to run, build and execute automated testing projects. The Scanner tool is used for capturing system or user events and sends them to the Test Manager for execution. It also includes: Export To JUnit XML to export the test results to an XML-format file. The WinRunner GUI also has some new features. The graphs in the GUI can now be configured to display the test results in different ways. You can also download a new Windows theme from the online Help. You can change the color of the selected text in the GUI. You can see whether any test is currently running or completed in the Testing Summary and History. You can add to the Build Script list of automated tests to run. When you have selected a run from the build script list, you can now directly run it. The output report now lists the last run for each script. The testing summary now lists both the individual tests as well as all the tests for the project. You can search for test data in the Data tab. You can modify the test results in the test results tab. The Test History now displays the test results for all the completed tests for all projects. 2d92ce491b
