To examine the role of MMP-1 and MMP-9 in the pathogenesis of ulcerative colitis. Endoscopic colitis was induced in rats by exposure to 2,4,6-trinitrobenzene sulfonic acid. Histologic activity index (HAI) was calculated on the basis of histologic features. Colonic MMP-1 and MMP-9 activities were determined by gelatin zymography. Histologic evaluation of rats exposed to 2,4,6-trinitrobenzene sulfonic acid demonstrated inflammatory cell infiltration, epithelial injury, and formation of ulcers. Colonic MMP-1 and MMP-9 activities were increased in the 2,4,6-trinitrobenzene sulfonic acid-treated group compared with controls. A significant increase in HAI was observed in 2,4,6-trinitrobenzene sulfonic acid-treated animals (pA series of different configurations of plasma display panels, commonly known as PDPs, have been developed for different display application.
