It runs the "Institute of Transuranium Elements" (ITE) and the research reactor "Rolf M. Ganshagen". ITE as a national competence center for the handling of irradiated nuclear material, such as spent nuclear fuel. In addition to this, ITE is the only Belgian government institution authorised to use radioisotopes for medical use in Belgium. The chemistry laboratory of CVM1 is responsible for the analysis of irradiated samples and related activities. Such samples include spent fuel from research reactors, production of radioisotopes and related research. Samples are stored and analyzed at the center for research and development (CRDi). An example of a radioisotope is technetium-99m, produced from the decay of technetium-99. In this case, 99Mo can be converted into 99mTc via a suitable chemical process. The chemical production of 99mTc can be monitored online using a molybdenum heater coupled to an alpha spectrometer, and this device will be the focus of this paper. It is a compact unit and has been in use at CVM1 for several years. It was developed as a very simple tool to aid the analysis of irradiated samples. Traditionally, the molybdenum heater has been operated with a flow of air, but in order to avoid the risk of fire, air is now replaced by oxygen. The alpha spectrometer is only able to measure the energy of the emitted alpha particles, but if the molybdenum heater breaks down, the alpha energy will change, and the spectrometer will not be able to measure the true alpha energy. This will lead to a false indication on the activity of 99mTc produced from the spent fuel. The molybdenum heater is a very sensitive device. It is highly reactive with water and air, and the device will fail if it comes into contact with water or air. This problem would be hard to detect, if there was no warning sign. In the past, the heater could be reactivated by going to

As part of the investigation, the police department has identified the suspect as 18-year-old Deangelo Fonua, of Honolulu. He was arrested Thursday at the Big G Warehouse on Menkaru Street, the police spokesman said. News of the incident was first reported by the Honolulu Star-Advertiser on Thursday and indicated that the electronic surveillance system used at the Skateland to protect the pizza rolls refrigerator had been tampered with. A reporter for the Star-Advertiser went to the scene Friday to conduct a follow-up. No one answered the door when she arrived at the warehouse and a call to Fonua’s mother, who is listed as his contact, went unanswered. No other arrests have been made at this time, according to police. “At this point, the alleged theft may have been an isolated incident or it may have been a deliberate act,” the police spokesman said. “We are in the initial stages of the investigation, and it’s too early to tell.” According to the police report, the theft occurred at 2:50 a.m. Thursday at the Skateland West parking lot, which is located at 1503 E. Middlefield Road. “The victim believed his property was stolen due to (the) report of the theft,” the police report said. There was no physical damage to the contents of the refrigerator, which is valued at \$1,000. The pizza roll case was stolen. The victim’s surveillance system includes “multiple cameras” that feed images to a central monitoring station. But the power in the Skateland parking lot substation was cut and the security system was taken offline between 2 a.m. and 4 a.m., when the theft took place, the police report said. When the power was restored, a 3e33713323
