Advanced random number generator for applications like PC games, multimedia, simulations, role-playing games and so on. It features a full command line interface with many advanced features and IPC, Sockets, Windows services, Multimedia API, ANSI C/C++ Runtime Library, multi-byte/multi-lingual characters and Unicode support. Random Number Generation: Random Number Generator produces numbers without repetition and eliminates the need for arrays, auto-generated IDs or time-consuming user programs to generate random numbers. Command Line Interface: Low-level interface for applications, that requires a fine-grained control over the random number generation. Generates numbers from 0-99999 and you can also set the probability of individual numbers with the help of an optional range. Additionally you can generate strings by passing patterns via command line. Multithreading: Designed for complex random number generation scenarios like video games, simulations and role-playing games. Real-time and event-driven, uses multithreading to create as many threads as your system allows and therefore guarantee high throughput, even for multiple-core systems and GPUs. Animation Dependency: Many of the aforementioned features are dependent on the video playback APIs of the graphics card. Because it is platform-dependent, you need to know the API of your graphics card in advance when programming. Also dependent on the graphics API is the capability to run the program as a Windows service. Inter-Process Communication: IPC is implemented as a standardized socket library and Windows Sockets, providing a clear upgrade path. Sequence and Pseudo-Randomness: Variation of number generation is based on Multilinear Replacement. The resulting number sequences are pseudo-random, and they are not disclosed on the server side. Command Line Interface: Command line interface for applications, that requires a fine-grained control over the random number generation.
