## SyncBackLite Download

SyncBackLite is an easy-to-use backup and synchronization utility that can be used to create copies of important files, also providing encryption and compression capabilities. Create a profile and configure data backup in detail To use SyncBackLite, you first have to create a profile. The integrated wizard can help you in this endeavor, guiding your every step until everything is ready. SyncBackLite can perform data backups, folder synchronizations or one-to-one copies (mirror profiles). It supports local or external drives, network folders, or FTP servers, both as a source and as a destination of the backup. You get to configure data filters to exclude certain files and folders and set up the scheduler to perform the task periodically and without intervention. While this is enough to create a new profile quickly, if you like being in control of every option, then you will be happy to know that the expert profile setup enables you to configure the newly created profile down to the last detail. For instance, the application enables you to manage file overwriting situations and decide upon the comparison algorithms, compression, encryption, and many more options. Simulate backup or sync tasks to check your settings One interesting feature of SyncBackLite is that it can simulate running the task without actually copying files. This option allows you to check whether the results are as expected and, if not, re-configure the settings. You can create an execution queue for your profiles and run then in unattended mode. Running a profile opens a new window where all the differences between the source and the destination are displayed. Each situation can be handled differently: you can either copy the files to the destination, or choose to skip, delete, or move them. With a single click, you can instruct SyncBackLite to mirror all the files and sync your two folders.
