Virtual Studio Technology (VST) plugins are basically sound processing software, used to create music and audio effects. In layman's terms, VST plugins add extra functionality to existing keyboards and synthesizers. VST (Virtual Studio Technology) plugins come with a "real" software (audio interface) that creates an additional channel on your soundcard which receives MIDI notes from the MIDI keyboard/keyboard patch and feeds them back to the software and produces sound in real time. The number of plugins available for VST is huge. Almost every sound processing or audio effect software, as well as many DAW (Digital Audio Workstation) software products (Cubase, Pro Tools, Logic, etc.) come with a free VST (Virtual Studio Technology) plug-in to make it even easier to create music and mix different instruments. VSTplayer is an easy to use software program for keyboard performers that wants to use VST plugins on stage. Built for musicians, VSTplayer uses a nice and simple GUI where the main object of interest is the proxy digital keyboard. You can use your mouse and keyboard, and receive visual feedback when certain keys on the MIDI keyboard are being pressed, giving their allocated effect. VST (Virtual Studio Technology) plugins basically bring additional functionality to existing keyboards and synthesizers via a digital audio workstation. These usually come with an extra GUI to the existing device for an improved user control. In this regard, VSTplayer does exactly that. Once a musician boots the software application, it will ask for existing MIDI keyboards or external device connections in order to properly transmit their signal. Available options: VSTplayer offers a limited amount of options to its users. Besides the four MIDI keyboard connections, users can change the audio interface which detects devices present in the soundcard. However, the list of control terminals is pretty exhaustive. When users open a new project, they can have up to 8 VST plugins opened with 3 VST effects on each row. Side by side (Fx): VSTplayer can be used as a two channel audio input with 4 different effects. Users can simply change the side of the two channel source to be inserted. Arpeggiator: VSTplayer also offers an 8 step arpeggiator, ideal for layering keyboard patterns. Randomize: Users can also select a key from their keyboard and have its corresponding random effect selected randomly. Volume: VSTplayer offers a basic volume fader and sound level monitoring. Tracking: VSTplayer offers a very basic CPU counter which shows how many VST plugins are being used, along with the total CPU load. Conclusions: VSTplayer is a great VST plugin platform that can hold a big number of plugins working concomitantly in each project. All of the eight simultaneous VST plugins can be individually fine-tuned to provide a desired effect for the perfect polyphony sound. With Midi keyboards attached, VSTplayer can become the main platform for both instrument and plugin management. This way, artists can multitask between devices with ease and create music with very little effort. Audio Note Overview: Audio Note is the result of different musical teachers and a musician who needed to search a unique and full-featured VST/AU plugin
