You can make Download Speed Test check for updates at program start, set the browser that should be simulated by the program, display traffic in bits instead of bytes, and choose an output location to hold all protocol events. * The first program I have ever written, and I'm glad I did it. It was very fun, and it was easier than I thought it would be. * It's only 3K (and a shell script which does the hard work). * Very usable, so I know it's usable and not bloated. * It's a .tar.gz package. Just untar it and run the program. Very easy to install. * Windows, MacOSX, BSD, and Linux. * Download speed testing is very easy. Just provide a URL (or HTTP file) and click test. * You can also test a Web server. Click test on the server first and then click test on the computer. * It runs either as a plugin or as a standalone browser. With the standalone browser, you can save statistics about downloads to a text file. * It doesn't use a hardcoded timer. It uses the shell timer to see if the specified URL has been up for the specified amount of time. * The start_time, stop_time, and elapsed_time variables are read from the shell. * Performance is so-so. There are some issues when using the current version. Use the latest version if you have issues.
