single-stage deltopectoral approach for primary breast reconstruction. The most effective and safe surgical techniques for primary breast reconstruction in women with a history of mastectomy, breast-conserving surgery, and adjuvant radiotherapy are unknown. The goal of this study was to examine a large, single-institution series of patients who underwent single-stage, prosthetic implant-based breast reconstruction via a deltopectoral approach with particular attention to surgical complications and revisional surgery. A review of all primary breast reconstructions using a single-stage approach from 1998 to 2008 was performed. One hundred and thirty-seven patients were identified who underwent single-stage, prosthetic implant-based breast reconstruction. Twenty-seven of 137 (20%) patients required breast revision due to capsular contracture, implant malposition, and/or exposure. The majority of these revisions (64%) were performed within 3 years of initial reconstruction. Eighty-eight percent of breast revisions were performed by an attending breast surgeon. Fifteen percent of patients required repeated, more extensive revisional surgery. Single-stage prosthetic breast reconstruction with a deltopectoral approach has a high rate of revisional surgery and the majority of breast revisions are performed by an attending breast surgeon. Furthermore, it may be associated with a higher rate of capsular contracture. Gene flow among primary and secondary broiler chicken flocks after release from hatcheries. This study investigated patterns of gene flow among primary and secondary broiler flocks that were released from a hatchery and established in a new environment over a period of 2 yr. Gene flow among flocks was estimated using autosomal micros 80eaf3aba8

Two U.S. Soldiers have been injured in a mortar attack by Afghan soldiers in southern Afghanistan, according to the NATO Resolute Support mission. One of the U.S. service members was taken to the Regional Medical Center in Landstuhl, Germany, for treatment of injuries sustained in the attack, according to an undated update. The second U.S. service member was also taken to Landstuhl for medical evaluation and treatment for injuries, it said. Both service members were previously injured while working on a construction project with Afghan soldiers, according to an update on the Resolute Support mission. “This attack follows another attack on coalition forces conducted earlier today by an Afghan soldier in which one U.S. service member was killed and another wounded in southern Zabul Province,” the update stated. The U.S. service members are both from the 1st Battalion, 187th Infantry Regiment of the New Jersey National Guard and were conducting combat operations in Zabul, in a joint Afghan and U.S. operation, according to the update. The Taliban claimed responsibility for the attack and said it killed two U.S. soldiers. The attack, however, does not signal a major shift in the tactics of the Taliban, who are known to carry out such attacks in the countryside when there are not many Afghan and U.S. forces on the ground, Brig.

Gen. Wilson Shoffner, commander of Resolute Support, told Pentagon reporters in July. “I think it is fair to say that we are not seeing a major change in Taliban tactics,” Shoffner said. “As we increase the numbers of our Afghan partners in the local security forces, they will be increasing their capabilities to combat this insurgency.” The military in Afghanistan has tried to train up Afghan forces to fight the Taliban, but they are still not ready to take over the fight. “There are over 9,000 ISAF troops and 350,000 Afghan National Security Forces,” Brig. Gen. Wilson Shoffner, commander of the Resolute Support Mission, told Pentagon reporters in July. “And
