A: They are encrypted or compressed files. It can be any random files. Open them with Software like WinZip and unzip/extract. The present invention relates to a portable operating apparatus, and in particular, to a portable operating apparatus used for remotely operating a remote controller apparatus to control industrial equipment. As general industrial equipment control apparatuses, there are well-known apparatuses called slave terminal devices. These slave terminal devices are installed at positions or in cabinets and have the capability to remotely control a variety of apparatuses through a communication path formed via a telephone line, radio, etc. An information processing apparatus is also well-known that is used to remotely operate the slave terminal device to control the slave terminal device. Such a remote control apparatus is generally capable of remotely controlling a plurality of slave terminal devices. For example, a slave terminal device is generally used for controlling multiple pieces of industrial equipment which are controlled by the multiple slave terminal devices. Such a remote control apparatus is well-known to be used by remotely operating the slave terminal device to change (e.g., stop or start) the operation of the industrial equipment. When performing remote operation of the industrial equipment through the slave terminal device, the remote control apparatus generally operates the remote controller apparatus and the slave terminal device. Therefore, in some cases, the remote control apparatus performs the remote operation at a location a long distance away from the master terminal device that is connected with the slave terminal device. In such cases, the remote control apparatus transmits, to the slave terminal device, instructions for controlling the remote controller apparatus via a wireless link using, for example, radio waves. The remote control apparatus therefore sends, to the slave terminal device, the instructions for controlling the remote controller apparatus via the wireless link. In addition, the remote control apparatus transmits, to the remote controller apparatus, management information such as setting information for remotely controlling the slave terminal device (e.g., setting information, etc.). The management information is used to perform, via the remote controller apparatus, the remote operation of the slave terminal device. In such a remote control apparatus, it is important that the remote controller apparatus and the remote control apparatus be connected to each other via the wireless link. That is, if the wireless link is interrupted, a plurality of operations to be performed by the remote controller apparatus and the slave terminal device are not performed as desired. Therefore, a remote control apparatus has been proposed that can keep such a wireless link active even when f30f4ceada
