PatchCleaner is a handy utility that determines which of the files in your Windows Installer folder are orphaned. It is designed with a specific purpose in mind, namely to clean your "WindowsInstaller" folder. To this end, the program consults a list generated by the operating system that contains all the current installers and patches. This information is compared against the MSI and MSP files located in the scanned directory, and any items that are not on the list are considered to

be orphaned and tagged for deletion. Analyze the scan results to ensure none of the listed files are still required Once a scan has been completed, PatchCleaner displays a brief summary of the results, letting you know how many files are still in use, how many have been excluded by filters and how many are orphaned. You can access more detailed information by clicking on one of the categories, should you wish to view each file's name, size and author. Set up exclusion filters and, optionally, move files to another location without deleting them

Certain products can be excluded from deletion by setting up a filter that takes the file's author, title, subject and digital signature into consideration. It should be noted that false positives are possible, so it is probably wise to first move the files to another directory before deleting them altogether. In conclusion, PatchCleaner is a lightweight application specially created to scan and clean your "WindowsInstaller" by locating orphaned installer and patch files. It is very novice-friendly and even allows you to move the items to a temporary location before

deleting them, to ensure none of them are still needed. Keymacro enables you to create macros by combining snippets of text in a simple and intuitive manner. Create your macros by combining various snippets of text with one or more actions. Actions are similar to

command line switches in other languages and are used to execute tasks that may require further information. For instance, the -d switch in the Windows command line requires a directory path to operate upon. Unlike commands, macros don't execute in the context of the application and work independently. They can be executed by pressing a key combination or by selecting a menu option. Macros can include snippets of code from various file types, allowing the user to create reusable snippets that can be shared with others. Keymacro

also has the unique capability of converting macros into scripts that can be executed using your operating system's shell. Keymacro works with the clipboard and uses it to store the macro snippets as well as to receive the macro outputs. Macros are reusable and you can save them as you wish. The 'Save' feature lets you save your macros in various files, including scripts. You can always open the macro that you have saved before. Apart from macros, Keymacro has a 'Main Menu' that contains the most frequently used actions. When you have completed a

macro, press the 'Save' button to save it as a file. Apart from macros, Keymacro has a 'Main Menu' that contains the most frequently used actions. In addition to macros and scripts, Keymacro also has a 'Main Menu' that contains the most frequently used actions. You can execute these actions using the keyboard (F1 or the command line) or by selecting the desired menu option. The Main Menu can be opened by clicking on the 'Main Menu' button. The most frequently used actions include the Save, Save as File and Help menu options. You

can create new files from templates and fill them with snippets of code by clicking on 'New File'. After creating a file, you can modify it by clicking on the desired line or modifying it in the 'Code Editable' view. After finishing the code, press the 'Save' button to save it in the clipboard. This tool can create temporary macros, scripts and scripts of scripts in a manner similar to TextExpander.
