Q: Drag and Drop data in AngularJS from any other controllers I have to drag and drop record from table1 to table2. Basically in table1, i have field 'Name' and 'Address', where Name is unique and Address is unique. First i have to select the row and drag it onto table2. When i drag the row then drop it onto table2, i have to show the value of name and address from table1 row to table2. Should i use some separate controller for this? I have used ng-drag-drop module but there is no ondrop event. Is there any good solution for it? A: i have used ng-drag-drop module but there is no ondrop event i suppose you are talking about ng-drop-zone. why not use it. in the link there is a perfect tutorial for drag and drop. and in the documentation there is a ondrop event function which you can use. for example. `$scope.ondrop = function($event) { console.log($event.item.propertyName); } $scope.$on('drop', function(event, item, source, target) { console.log(item, source, target); });` GREEN BAY, Wis. -- A year ago, the Green Bay Packers were treading water for much of the season and were 18th in the league in yards allowed per game. But under the inspired direction of coach Mike McCarthy, they climbed into the top half of the league and made the playoffs for the first time since 2010. By the end of 2016, his second season at the helm, McCarthy has shifted the defense from one of a bunker mentality to one of aggressiveness and assertiveness. The biggest difference? New defensive coordinator Dom Capers. "Dom's a great guy, great leader, great football guy," linebacker Clay Matthews said. "Just his personality is unlike anything I've ever seen. He's a bit of an over the top communicator. He's pretty animated. He loves football." It's something Matthews has quickly come to love too. "I think it's good for the game. You're not gonna play the game like coach the game. You're gonna play the game like coach the game," Matthews said. "Whether I'm in the game or not

## What's New In?

Q: What exactly is a "tail"? I've read that a branch is a tail. Is that because every branch "ends" at a particular node? Thus the "terminal" node is the "head" or "front"? A: Your terminology is a bit off. Let's say that we have a graph with three nodes: A, B, C. A is the root (or head), C is the terminal (or tail). There is nothing inherent in a graph that requires it to have a root node. We can draw a graph without a root node, and it'll still make sense. As long as there is a path from A to C, then the graph has a terminal node and that is all that is required. There is no requirement for that path to be unique or to include any intermediate nodes. Time for some fun! Yeah! I'm in the mood for something fun today! Oh well, why not? It's actually a mood not to be particularly in today. Just leave me alone. I need peace and quiet. Okay, so this is gonna be a bit of a ramble, since I don't really have anything to talk about per se, but hey, it's a blog, and I get to ramble around all the time. Only, not too much. I started working on that thing which I'm supposed to be working on before I can do anything else (make bread I started that one, then I was in a road trip with my boyfriend, so I haven't really had the chance to take a look at it). But it's going. It's not going very well, but I'm starting to see what I'm supposed to. I hope. Anyway, so, between the date, and the fact that I've got to start working on the first pages of the book, I've had some free time. And I've used it up, I'm afraid. So, I decided to go shopping. I think this is an outfit I'll wear, in the summer. I found these jeans at Zara. I'd been looking for a good pair of jeans, and Zara had these in my size
