3D modeling Three-dimensional (3D) modeling tools used to create and edit 3D models on a computer. 3D modeling software includes various application packages that let a user model in 3D. Drawing tools and other options are added for easy handling of 3D models. For example, some CAD software enables users to easily create 3D models of 3D objects, similar to placing text on a 2D CAD drawing. Related to 3D modeling, there are also services that handle 3D model construction by collating and organizing digital data from a wide range of 3D content sources, like, computers, scanners, digital cameras, and geographic information systems (GIS) data. Another approach is to produce and sell 3D models. 3D modeling is not the same as 3D printing. 3D modeling allows for the production of 3D geometry, which can be manipulated in CAD software. 3D printing allows for the production of 3D geometry in an additive fashion. Both processes can produce 3D objects, such as models, maps, and videos. CAD vs. CAM In general, CAD refers to a family of computer-aided design (CAD) applications that create two-dimensional and three-dimensional drawings. CAD software is used for design of technical products and services. CAM refers to a set of software tools used for designing manufacturing processes. CAM software is used to help fabricate physical products such as metal, plastics, wood and wood-based products. In the early days of CAD, the two terms were used interchangeably. With increasing sophistication of technology, CAD and CAM systems are being deployed at the same time and have become complementary tools.
