1. we present an approach to the generation of anatomically realistic 3d atlases in the context of the unique visual challenge of presenting images of human anatomy. the atlases are based on medical ct and mri images of the human body and can be represented as structured 3d surfaces. we present a complete workflow for creating anatomically realistic 3d atlases. it consists of the following steps: data acquisition, data preparation, atlas creation, and atlas evaluation. the workflow is aimed at biologists, who are interested in understanding the normal anatomy of human body structures and in identifying and locating these structures in the context of their functions. we demonstrate the

workflow by creating two atlases: one of normal human anatomy, the other of a subset of the brain and cerebellum. the former is an atlas of the entire body, and the latter is an atlas of selected brain regions.

64 an anatomical
atlas provides a
detailed map for
medical and
biological studies
of anatomy. these
atlases are
important for
understanding

normal anatomy
and the
development and
function of
structures, and for
determining the
etiology of
congenital
abnormalities.
unfortunately, for
biologists,

generating such atlases is difficult, especially ones with the informative content and aesthetic quality that characterize human anatomy atlases. building such atlases

requires
knowledge of the
species being
studied and
experience with an
art form that can
faithfully record
and present this
knowledge, both of
which require
extensive training

in considerably
different fields. (for
some background
on anatomical
atlases, see the
related sidebar.) jai
